

Fonteva Spark Plugs

Feature Overview

Spark Plugs are a Fonteva Developer feature that enables the inclusion of custom Lightning Components into default Fonteva process flows through an **Extension Point**. The Extension Point is a pre-defined, pre-loaded metadata record that instructs the platform when and what to inject into a Fonteva workflow, enabling customized community experiences. Multiple components can also display on each Extension Point. For example, if an org requires additional Customer information not captured through the default Fonteva Apply Payment page, a Spark Plug can be used during Customer Checkout to inject a custom payment page, capture the required information, and then return control to the default Fonteva Checkout flow. To use extension points, developers must have a completed custom Lightning Component and create a new Custom Metadata Type record under **Spark Plug Extensions** referencing that Component.

Prerequisites

- The requisite Fonteva release requirements vary according to the specific Extension Point utilized. Refer to the Spark Plug Extension Points reference article for details on each available Extension Point and the required release.
- A developed Custom Lightning Component that will execute/display when the Extension Point is engaged.

Audience

Spark Plug Extension Points are enabled, configured, and implemented by Fonteva Customers with Administrator permissions, software development experience, and a clear understanding of Fonteva objects and relationships.
